SESSION 4

1. Create Playlist and data

Create the music playlist table and insert five songs.

```
CREATE TABLE Playlist (id INT PRIMARY KEY AUTO_INCREMENT,song_name VARCHAR(100),artist VARCHAR(100),genre VARCHAR(50),pla
INSERT INTO Playlist (song_name,artist,genre,play_count) VALUES
 ('Blinding Lights','The Weeknd','Pop',250),('Levitating','Dua Lipa','Pop',180),
 ('Gods Plan','Drake','Hip-Hop',320),('Lose Yourself','Eminem','Hip-Hop',400),('Perfect','Ed Sheeran','Pop',95);
```

2. Select with alias

AS renames the output heading without changing the actual column name.

```
SELECT song_name, artist AS Singer FROM Playlist;
```

3. Filter and sort

Only Pop songs above 100 plays are returned, sorted from most to least plays.

```
SELECT * FROM Playlist
WHERE genre='Pop' AND play_count > 100
ORDER BY play_count DESC;
```

4. COUNT aggregate

COUNT counts rows that match the condition.

```
SELECT COUNT(*) AS hip_hop_song_count FROM Playlist WHERE genre='Hip-Hop';
```

5. SUM grouped by genre

GROUP BY creates one result row for every genre.

```
SELECT genre, SUM(play_count) AS total_plays
FROM Playlist
GROUP BY genre;
```
